

MD Media — Team Activity Dashboard

Developer brief v1 Prepared for: internal dev Owner: Divina Armuela Date: 30 July 2026

1. The problem

MD Media has ~13 team members, a mix of full-time employees, contractors, and remote/offshore staff. Work is tracked in Asana. Leadership currently has no consolidated view of whether work is progressing through the day — only whether tasks eventually get marked complete.

We want a single dashboard that answers: **what has actually moved today, and by whom.**

2. Objective

Build an internal web dashboard that aggregates timestamped work activity per team member from the tools we already use, and presents it as a daily and weekly view.

3. Explicit non-goals

The following are **out of scope and must not be built**:

- Screenshots, screen recording, or webcam capture
- Keystroke or mouse logging
- Anything installed on a team member's personal device
- Anything that runs invisibly or that the team is not told about

Rationale: these carry legal exposure under Australian privacy and workplace law, they're a poor proxy for output, and they cost more in team trust than they return in information. The dashboard measures work product, not presence.

Design requirement: every team member must be able to see their own view of this dashboard. If a metric is too sensitive to show the person it's about, it doesn't go in.

4. Data sources

Primary — Asana (required)

Standard Asana API, available on our current plan. No Enterprise+ needed.

Pull, per user:

- Task completions (`completed_at` , `completed_by`)
- Task creation and assignment changes
- Comments and status updates (the `stories` endpoint gives timestamped activity per task)
- Task modifications (`modified_at`)
- Due dates and overdue state

Recommended architecture: **Asana webhooks** rather than polling. Webhooks push events to our endpoint as they happen, which avoids rate-limit problems and gives accurate timestamps. Use the `/events` endpoint as a backfill/reconciliation mechanism.

Secondary — Slack (optional, phase 2)

- Message volume per user per channel per day (public/internal channels only, no DM content)
- Do **not** rely on Slack presence (`users.getPresence`) as a work signal. It reports “active” whenever the app is open, which is close to meaningless.

Not in scope for v1

Google Workspace admin activity reports, Harvest/time tracking, calendar data. Revisit after v1 is in use.

5. Core views

A. Today Per team member, a horizontal timeline of the working day showing when activity events occurred. Gaps are visible but not flagged or scored — this is context for a conversation, not an alert.

B. Rollup Table, filterable by date range and by team member:

- Tasks completed
- Tasks currently assigned / in progress
- Tasks overdue

- Last activity timestamp
- Activity events in period

C. Client view Same data cut by client/project instead of by person. Answers “is the StretchWorks work moving” rather than “is Ryan working.”

D. Individual view Each team member’s own version of A and B, for themselves. Same data, no comparison to peers.

6. Technical requirements

- Web app, desktop-first, mobile-readable. Internal use only.
- Auth: Google SSO restricted to @mdmmarketing.com.au, plus a way to handle contractors on external addresses.
- Two roles: **admin** (Divina, Martin, Abby — sees everyone) and **member** (sees own data + client view).
- Store raw events with timestamps in our own database. Asana’s own history isn’t queryable far enough back for trend analysis.
- Timezone handling matters: we have staff in Singapore and Colombia. Store UTC, display in each viewer’s local timezone, and make the “working day” window configurable per person.
- Contractors and employees should be distinguishable in the data model — the expectations are genuinely different and the dashboard shouldn’t imply otherwise.

7. Build phases

Phase	Scope	Purpose
1	Asana ingestion + rollup table (view B)	Proves the data is useful before building UI polish
2	Today timeline (view A) + individual view (D)	The daily-visibility piece
3	Client view (C)	Ties activity to client delivery
4	Slack volume, alerting on overdue tasks	Only if phases 1–3 are actually being used

Ship phase 1 and let it run for two weeks before building phase 2. If the rollup already answers the question, phase 2 may be unnecessary.

8. Compliance requirement

Before this goes live, the team must be told in writing what is collected, why, who can see it, and how long it's retained. Build a visible in-app notice stating the same. This needs legal sign-off (Raween, Vizzone Ruggero Twigg) before rollout — not after.

9. Questions for the developer

1. Do we have Asana admin access sufficient to register webhooks across all projects, or does that need a service account?
2. Preferred hosting / stack, given whatever else you maintain for us?
3. Rough build estimate for phase 1 alone?
4. Is there an off-the-shelf tool that covers 80% of phase 1? If so, say so — buying beats building here if the fit is close.

10. Acceptance criteria for phase 1

- Ingests Asana activity for all active projects with no manual intervention
- Rollup table accurate against a manual spot-check of three team members over three days
- Loads in under three seconds
- Every team member can log in and see their own data
- Written team notice sent and legally reviewed
